1.

Factor product.

Let X, Y and Z be binary variables.

If $\phi_1(X, Y)$ and $\phi_2(Y, Z)$ are the factors shown below, compute the selected entries (marked by a '?') in the factor $\psi(X, Y, Z) = \phi_1(X, Y) \cdot \phi_2(Y, Z)$, giving your answer according to the ordering of assignments to variables as shown below.

Separate each of the 3 entries of the factor with spaces, e.g., an answer of

0.1 0.2 0.3

means that $\psi(1, 1, 1) = 0.1$, $\psi(1, 2, 1) = 0.2$, and $\psi(2, 2, 2) = 0.3$. Give your answers as exact decimals without any trailing zeroes.

X	Y	$\phi_1(X, Y)$	Y	Z	$\phi_2(Y, Z)$	X	Y	Z	$\psi(X, Y, Z)$
1	1	0.8	1	1	0.2	1	1	1	?
1	2	0.5	1	2	0.2	1	2	1	?
2	1	0.5	2	1	0.9	2	1	1	
2	2	0.6	2	2	1.0	2	1	2	
						2	2	1	
						2	2	2	?

Factor reduction.

Let X, Z be binary variables, and let Y be a variable that takes on values 1, 2, or 3.

Now say we observe $Y = 1$. If $\phi(X, Y, Z)$ is the factor shown below, compute the missing entries of the reduced factor $\psi(X, Z)$ given that $Y = 1$, giving your answer according to the ordering of assignments to variables as shown below.

As before, separate the 4 entries of the factor by spaces.

X	Y	Z	$\phi(X, Y, Z)$
1	1	1	14
1	1	2	60
1	2	1	40
1	2	2	27
1	3	1	42
1	3	2	85
2	1	1	4
2	1	2	59
2	2	1	54
2	2	2	3
2	3	1	96
2	3	2	30

X	Z	$\psi(X, Z)$
1	1	?
1	2	?
2	1	?
2	2	?

14 60 4 59

3.

Properties of independent variables.

Assume that A and B are independent random variables. Which of the following options are always true? You may select 1 or more options.

$$P(B|A) = P(B)$$

正确

In intuitive terms, this means that the value of B is not dependent on the value of A . We can derive this from $P(A, B) = P(A) \times P(B)$ as follows:

Basic Definitions

测验, 4 个问题

therefore $P(A, B) = P(A) \times P(B)$ (by definition of independence)
 $= P(B|A) \times P(A)$ (by chain rule of probabilities)
 $P(B|A) = P(B).$

$$P(A, B) = P(A) \times P(B)$$

正确

This is the standard definition of independence.

$$P(A) = P(B)$$

未选择的是正确的

$$P(A) \neq P(B)$$

未选择的是正确的

4.

Factor marginalization.

Let X, Z be binary variables, and let Y be a variable that takes on values 1, 2, or 3.

If $\phi(X, Y, Z)$ is the factor shown below, compute the entries of the factor

$$\psi(Y, Z) = \sum_X \phi(X, Y, Z),$$

giving your answer according to the ordering of assignments to variables as shown below.

Separate the 4 entries of the factor with spaces, and do not add any extra trailing or leading zeroes or decimal points.
